

INVESTOR IN PEOPLE

The Patent Office
Concept House
Cardiff Road
Newport
South Wales
NP10 8QQ

I, the undersigned, being an officer duly authorised in accordance with Section 74(1) and (4) of the Deregulation & Contracting Out Act 1994, to sign and issue certificates on behalf of the Comptroller-General, hereby certify that annexed hereto is a true copy of the documents as originally filed in connection with the patent application identified therein.

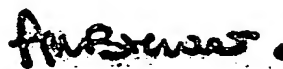

In accordance with the Patents (Companies Re-registration) Rules 1982, if a company named in this certificate and any accompanying documents has re-registered under the Companies Act 1980 with the same name as that with which it was registered immediately before re-registration save for the substitution as, or inclusion as, the last part of the name of the words "public limited company" or their equivalents in Welsh, references to the name of the company in this certificate and any accompanying documents shall be treated as references to the name with which it is so re-registered.

In accordance with the rules, the words "public limited company" may be replaced by p.l.c., plc, P.L.C. or PLC.

Re-registration under the Companies Act does not constitute a new legal entity but merely subjects the company to certain additional company law rules.

Warning

After an application for a patent has been filed, the Comptroller of the Patent Office will consider whether publication or communication of the invention should be prohibited or restricted under Section 22 of the Patents Act 1977. You will be informed if it is necessary to prohibit or restrict your invention in this way. Furthermore, if you live in the United Kingdom, Section 23 of the Patents Act 1977 stops you from applying for a patent abroad without first getting written permission from the Patent Office unless an application has been filed at least 6 weeks beforehand in the United Kingdom for a patent for the same invention and either no direction prohibiting publication or communication has been given, or any such direction has been revoked.

Notes

- a) If you need help to fill in this form or you have any questions, please contact the Patent Office on 08459 500505.
- b) Write your answers in capital letters using black ink or you may type them.
- c) If there is not enough space for all the relevant details on any part of this form, please continue on a separate sheet of paper and write "see continuation sheet" in the relevant part(s). Any continuation sheet should be attached to this form.
- d) If you have answered 'Yes' Patents Form 7/77 will need to be filed.
- e) Once you have filled in the form you must remember to sign and date it.
- f) For details of the fee and ways to pay please contact the Patent Office.

IMPROVEMENTS IN OR RELATING TO AN AIR-BAG

5

DESCRIPTION OF INVENTION

10 THE PRESENT INVENTION relates to an air-bag, and more particularly relates to an air-bag having a vent hole formed therein.

It is known to be desirable to vent an air-bag provided for use as a safety arrangement in a motor vehicle to protect an occupant of the vehicle in the event that an accident should occur. It is known to be particularly important to vent an air-bag if the air-bag is of the type intended to provide protection in the event that a front impact should occur.

An air-bag that is intended to provide protection in the case that a front impact should occur is generally located so that, when inflated, the air-bag is positioned in front of the occupant of the vehicle to be protected. During the front impact, the motor vehicle will decelerate very suddenly. Due to inertia, the occupant of the vehicle tends to continue moving, and thus the occupant of the vehicle is, in effect, moving forwardly relative to the rest of the vehicle, and thus the occupant moves forwardly relative to the air-bag itself. The function of the air-bag is to decelerate the occupant, preferably in such a way that the occupant suffers no or only relatively slight injuries. The air-bag must be inflated very swiftly in the event of an accident and thus, typically, contains relatively high-pressure gas when inflated. If the air-bag were not vented, then

because of the high pressure of gas within it, the air-bag would not decelerate the occupant gently, but instead would stop the occupant extremely swiftly and hence may injure the occupant. It is thus known to provide air-bags with one or more vent holes formed in them so that, when the air-bag is struck by the occupant in a crash situation, gas can escape from the air-bag through the vent hole or holes, so that the air-bag serves the function of decelerating the occupant more gently, to avoid serious injury.

It has been found to be advantageous to configure the or each vent hole of an air-bag so that the venting flow of gas passing through the vent hole as an occupant strikes the air-bag can be directed along a predefined flow path. It is particularly advantageous to be able to direct the flow of venting gas from the interior of the air-bag, away from the occupant, because typically, the gas used to inflate air-bags in motor vehicles is generated at high temperature which can cause serious burns if it is directed towards an occupant during a crash situation.

JP01277991-A discloses a prior arrangement to direct the venting flow of gas from the interior of an air-bag, such that the gas flows in directions substantially tangential to the outermost surface of the air-bag rather than generally orthogonal to the outermost surface of the air-bag. This is achieved by providing each vent hole with a cover flap which is configured to form a duct to direct the venting gas flow as desired. However, the provision of a separate fabric cover over the vent hole, in addition to the fabric of the air-bag, is considered to be disadvantageous, because it necessitates stitching together of the two pieces of fabric, thereby complicating the manufacturing process of to produce the air-bag.

It is therefore an object of the present invention to provide an improved air-bag having a vent hole formed therein.

Accordingly, the present invention provides an air-bag having a vent
5 hole formed therein, the periphery of the vent hole having first and second
opposed parts, wherein a tuck is formed in the air-bag in the region of said first
part such that said second part extends past said first part in a direction
extending substantially outwards from the interior volume of the air-bag, when
the air-bag is inflated.

10

Preferably, said tuck defines a pleat in the air-bag.

Advantageously, said tuck is tapered.

15 Conveniently, said tuck is formed by a fold in the air-bag, the fold
intersecting the first part of the vent hole periphery.

Preferably, said tuck is at least partly defined by a seam intersecting said
first part of the vent hole.

20

Advantageously, said tuck is formed by stitching together two regions of
the air-bag.

Conveniently, said tuck is formed so as to lie inside the interior volume
25 of the air-bag.

Preferably, said tuck is folded and secured against the interior surface of
the air-bag.

Advantageously, said tuck is secured against the interior of the air-bag by stitching.

5 Conveniently, the air-bag has a plurality of said vent holes, each vent hole having a respective said tuck provided in the region of its periphery.

So that the invention may be more readily understood, and so that further features thereof may be appreciated, embodiments of the present invention will
10 now be described, by way of example, with reference to the accompanying drawings, in which:-

FIGURE 1 is a perspective view of an air-bag having a vent-hole formed therein prior to manipulation to produce an air-bag in accordance with the
15 present invention;

FIGURE 2 illustrates different shapes of vent hole which can be used to form an air-bag in accordance with the present invention;

FIGURE 3 is an enlarged perspective view of the vent hole of an air-bag, showing a tuck being provided in the material of the air-bag, adjacent to
20 the vent hole.

FIGURE 4 corresponds generally to Figure 3, but illustrates the tuck of material being folded to assume an alternate position;

FIGURE 5 is a perspective view of an air-bag having a vent-hole configured in accordance with the present invention; and

25 FIGURE 6 is a perspective view corresponding generally to that of Figure 5, but illustrating an alternative orientation of the vent hole, in accordance with another embodiment of the present invention.

Having regard initially to Figure 1, there is illustrated an air-bag 1 of generally circular configuration, particularly suitable for installation within the housing of a steering wheel to provide protection to the driver of a motor vehicle in the event of a frontal impact. Whilst the air-bag of the present invention is particularly suitable for use as a frontal impact air-bag, it should be appreciated that air-bags in accordance with the present invention can take any convenient configuration and can be used to provide protection in other types of accident situations.

The air-bag 1 illustrated in Figure 1 comprises a front layer of flexible material 2 and a rear layer of flexible material 3. The front and rear layers of flexible material preferably comprise fabric material. The front and rear layers of material 2, 3 are interconnected with one another around their respective peripheries to form an interconnecting seam 4. However, it should be appreciated that the front and rear layers of material 2, 3 could be formed integrally with one another, for example via a one-piece weaving technique, in which the warp and weft yarns of one layer of fabric are interconnected with the warp and weft yarns of the other layer of fabric as the two layers are woven simultaneously.

The rear layer of material 3 is provided with a generally centrally-located gas inlet aperture 5 and has a plurality of smaller mounting apertures 6 formed through the rear layer 3 around the periphery of the gas inlet aperture 5. The gas inlet aperture 5 is provided to receive part of an inflator such as, for example, a gas generator, and the mounting apertures 6 are provided to secure the rear layer 3 to the inflator around the periphery of the gas inlet aperture 5.

A vent hole 7 is also provided in the rear layer of air-bag material 3. The

particular vent hole 7 illustrated in Figure 1 has a substantially elliptical periphery having first and second opposed parts 8a, 8b.

Figure 2 illustrates four different shapes of vent hole 7 which can be used in the air-bag of the present invention. It will be seen that the vent hole illustrated in Figure 2b is largely identical in shape to the elliptical vent hole 7 illustrated in the air-bag 1 shown in Figure 1. Figure 2a illustrates a vent hole taking the form of an elongate slit which can be provided in the material of the air-bag. Figure 2c illustrates an alternative form of vent hole which has a periphery of generally "peanut" or "figure of eight" shape. Figure 2d illustrates a circular vent hole. It will be seen from Figure 2, that each of the four different configurations of vent hole illustrated have a periphery 8 having a pair of opposed parts 8a, 8b.

Figure 3 illustrates a stage during the manufacture of an air-bag in accordance with the present invention. The illustration shown in Figure 3 is an enlarged perspective view of a vent hole 7 such as, for example, the elliptical vent hole illustrated in Figure 1 and Figure 2a, and the surrounding region of material defining the air-bag 1. It will be seen from Figure 3 that the material of the air-bag in the region immediately adjacent the first part 8a of the periphery 8 of the vent hole 7 has been manipulated so as to define a tapered tuck 9 in the material. The first part 8a of the vent hole periphery 8 has been folded into a substantially "T"-shaped configuration to define the tuck 9 which takes the form of a generally triangular-shaped tapering dart formed in the fabric of the air-bag, having a fold 10 formed in the material of the air-bag.

The tuck 9 is directed inwardly of the air-bag so as to lie inside the interior volume of the air-bag. At the surface of the air-bag, regions of the air-

bag material are secured together by a seam 11 which can be formed, for example, by stitching, and which intersects the periphery of the vent hole 7.

It will be seen that because a tuck has been provided in the air-bag material in the region of the first part 8a of the vent hole periphery 8, the effect is to shorten the first peripheral part 8a of the vent hole 7 relative to the opposed peripheral part 8b of the vent hole 7. The effect of this is that the material of the air-bag in the region of the opposed part 8b of the vent hole 7 becomes configured so as to project or extend past the first part 8a of the periphery in a direction extending substantially outwards from the interior volume of the air-bag, so as to define a small duct to direct a venting outflow of gas from the interior of the air-bag to the exterior of the air-bag in a direction generally aligned with the tuck 9 formed in the material.

Figure 4 illustrates the tuck 9 having been folded in the region of the seam 11 so as to lie adjacent the interior surface of the air-bag. The tuck 9 can be secured in this position against the interior surface of the air-bag by, for example, by way of a further line of stitching 12 formed in the region of the fold 10.

Turning now to consider Figure 5, there is illustrated a completed air-bag generally in accordance with the present invention, having a vent hole configured as illustrated in Figures 3 and 4. The vent hole 7 is oriented such that the seam 11 lies substantially perpendicular to a notional radial axis of the circular air-bag 1. It will therefore be seen that with this orientation of the vent holes 7, when the air-bag 1 is inflated, the part 8b of the vent hole periphery extends outwardly past the first part 8a of the vent hole periphery so as to define an outwardly-projecting duct which, it will be appreciated, is configured

to direct a venting outflow of gas across the rear surface of the air-bag in a direction substantially parallel to the seam 11, as illustrated by arrows 13.

Figure 6 illustrates an alternative orientation of the vent holes 7, in which the seam 11, and hence also the tuck 9 (not shown in Figure 6) is directed generally radially outwardly from the gas inlet aperture 5 of the air-bag 1. This results in a venting outflow of gas upon inflation of the air-bag which is directed radially outwardly from the interior volume of the air-bag 1.

It should therefore be appreciated that the vent holes 7 of an air-bag in accordance with the present invention can be oriented relative to the air-bag to provide a predetermined venting outflow direction, and hence can be orientated specifically to direct the venting outflow of gas away from certain parts of the vehicle structure or away from an occupant of the motor vehicle, to prevent injury to the occupant in the event of an accident.

It should be appreciated that whilst the present invention has been described above as having a tuck 9 in the form of a tapering dart, the tuck 9 could alternatively take the form of a non-tapering pleat in the material of an air-bag, in which case the pleat could be provided so as to extend from the periphery of the vent hole to the edge of the material defining the air-bag.

In the present Specification "comprises" means "includes or consists of" and "comprising" means "including or consisting of".

The features disclosed in the foregoing description, or the following Claims, or the accompanying drawings, expressed in their specific forms or in terms of a means for performing the disclosed function, or a method or process for attaining the disclosed result, as appropriate, may, separately, or in any

combination of such features, be utilised for realising the invention in diverse forms thereof.

CLAIMS:

1. An air-bag having a vent hole formed therein, the periphery of the vent
5 hole having first and second opposed parts, wherein a tuck is formed in the air-bag in the region of said first part such that said second part extends past said first part in a direction extending substantially outwards from the interior volume of the air-bag, when the air-bag is inflated.
- 10 2. An air-bag according to claim 1, wherein said tuck defines a pleat in the air-bag.
3. An air-bag according to claim 1, wherein said tuck is tapered.
- 15 4. An air-bag according to any preceding claim wherein said tuck is formed by a fold in the air-bag, the fold intersecting the first part of the vent hole periphery.
5. An air-bag according to any preceding claim, wherein said tuck is at
20 least partly defined by a seam intersecting said first part of the vent hole.
6. An air-bag according to any preceding claim, wherein said tuck is formed by stitching together two regions of the air-bag.
- 25 7. An air-bag according to any preceding claim, wherein said tuck is formed so as to lie inside the interior volume of the air-bag.
8. An air-bag according to claim 7, wherein said tuck is folded and secured against the interior surface of the air-bag.

9. An air-bag according to claim 8, wherein said tuck is secured against the interior surface of the air-bag by stitching.
- 5 10. An air-bag according to any preceding claim, having a plurality of said vent holes, each vent hole having a respective said tuck provided in the region of its periphery.

ABSTRACT

5 IMPROVEMENTS IN OR RELATING TO AN AIR-BAG

An air-bag (1) is disclosed which has a vent hole (7) formed therein. The periphery (8) of the vent hole has first (8A) and second (8B) opposed part,
10 wherein a tuck (9) is formed in the air-bag. The tuck (9) is formed in the region of the first part (8A) of the vent hole periphery (8) such that the second part (8B) of the vent hole periphery (8) extends past the first part (8A) in a direction extending substantially outwards from the interior volume of the air-bag (1), when the air-bag is inflated.
